Jan/16/24

Lab - 6

1) Demonstrate various constructors in String

Str 1 : Hello
Str 2 : world
Str 3 : Or !
Str 4 : Hello
Str 5 : Java

2)
Str = "Hello. World"
String length = 12

3) demonstrate toString()

output:

101. mrunalini Bangalore
102. mrunal Mysore.

4) Using getchars(), Extract Bmscc from "welcome to Bmscc college"

Output : Bmscc

5) Demonstrate getbytes(), tochar Array()
with Proper Java Programs

Output : (i) getbytes()
Hello, world!

(ii) tochar Array()
J a v a P r o g r a m m i n g

6) Check the following output and write the Java Programs using Stringfunction

i. Bmscc Equals Bmscc → true
ii. Bmscc Equals College → false

Bmscc Equals BMSCE → false.

Bmscc Equals IgnoreCase BMSCE → true

Output :-

```
Public class StringComparisonExample {
    Public Static Void main (String [] args) {
        String Str1 = "Bmscc";
        String Str2 = "College";
        String Str3 = "BMSCE";
System.out.Println (Str1 + "Equals" + Str1 +
        "->" + Str1.Equals (Str1));
System.out.Println (Str2 + "Equals" + Str2 +
        "->" + Str1.Equals (Str2));
System.out.Println (Str1 + "Equals" + Str3 +
        "->" + Str1.Equals (Str3));
System.out.Println (Str1 + "Equals" + Str4 +
        "->" + Str1.Equals (Str4));
    }
}
```

7) Using regionMatches() find Substring "Bmscc College" from String "Welcome to Bmscc College of Engineering", display Substring is matched otherwise display not matched

Output :- Substring is matched

8) Demonstrate StartsWith() to give output true & false.

Sol:- import java.lang.String;

Public class Star {

Public Static Void main

output: Check whether String Starts with Welcome at Pos 11: false

Check whether String Starts With Bmscc at Pos 11: ~~false~~ true.

9) Demonstrate EndsWith() to give output ~~true~~ and false

Output: True
False

10) Demonstrate a java Program to show output for Equals() vs ==

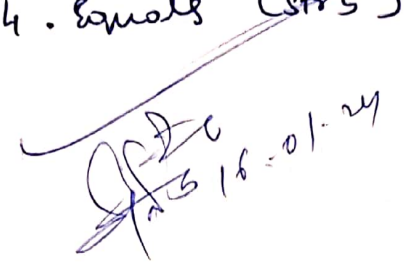
Output: Using == with String literals:
Str1 == Str2 : true
Str1 == Str3 : false
Using Equals() with String literals:
Str1.Equals(Str2) : true
Str1.Equals(Str3) : true

using == with new String Objects:

Str4 == Str5 : false

using equals() with new String Objects:

Str4.equals(Str5): true



LAB -6

PROGRAM-1

SOURCE CODE:

```
public class StringConstructorExample {
   public static void main(String[] args) {
      // Using String Literal
      String str1 = "Hello, World!";

      // Using new keyword and character array
      char[] charArray = {'H', 'e', 'l', 'l', 'o'};
      String str2 = new String(charArray);

      // Using another String
      String original = "Java Programming";
      String str3 = new String(original);

      // Using StringBuilder
      StringBuilder stringBuilder = new StringBuilder("Java");
      String str4 = new String(stringBuilder);

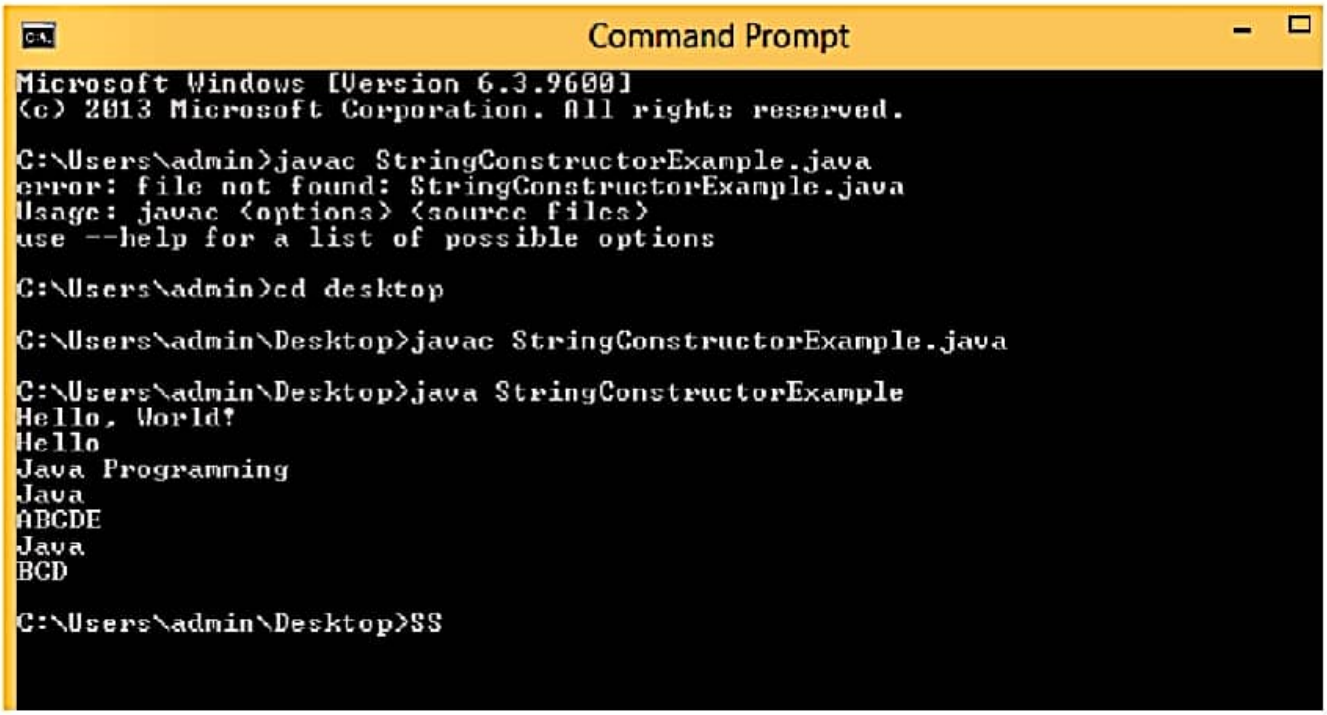
      // Using byte array
      byte[] byteArray = {65, 66, 67, 68, 69}; // ASCII values for A, B, C, D, E
      String str5 = new String(byteArray);

      // Using part of a character array
      char[] charArray2 = {'J', 'a', 'v', 'a', ' ', 'P', 'r', 'o', 'g', 'r', 'a', 'm', 'm', 'i', 'n', 'g'};
      String str6 = new String(charArray2, 0, 4); // "Java"

      // Using part of a byte array
      byte[] byteArray2 = {65, 66, 67, 68, 69}; // ASCII values for A, B, C, D, E
      String str7 = new String(byteArray2, 1, 3); // "BCD"

      // Print the strings
      System.out.println(str1);
      System.out.println(str2);
      System.out.println(str3);
      System.out.println(str4);
      System.out.println(str5);
      System.out.println(str6);
      System.out.println(str7);
   }
}
```

OUTPUT:



PROGRAM-2

SOURCE CODE:

```
public class StringOperationsDemo {
